

A 3mm x 15mm representative sample is used to demonstrate the use of the pressure applicator in long axis polishing. The sample is made of a more flexible material to exaggerate the clamping effect of 1 axis clamping in this application. While using the Pressure Applicator, in conjunction with the small clamp, the bending was eliminated, and clamping security was increased.

The Standard Tip can still be used for the 3mm Height. Although more optimally size tips can be designed in the future if the need arises.
